3. Protection

- **Input over voltage protection**

Mains up to 320 Vac, for two hours maximum, will not destroy both the unit and the load; shut down of load might occur in this condition.

- **Output short circuit protection**

Short circuit current is limited to approx. 1 A without damage to the unit, for unlimited time.

See typical operating window graph for details. Be sure the load is designed to withstand the short circuit current as well.

- **Output overload protection**

The unit is intrinsically protected against overloading because the output voltage is limited.

- **Output over voltage protection**

Shut down of load happens if output voltage exceeds 54 V; mains switchover is needed to restart the unit.

To avoid unexpected power off, be sure the LED module operating voltage never exceeds 54 V, including cold start condition.

- **Output under voltage protection**

The unit is not damaged if the load voltage is lower than 27 V, but the load current increases up to the short circuit value, see typical operating window graph for details. Be sure the load is safely operated if this event might occur.

- **No load operation**

The unit is not damaged in this condition; the output voltage is lower than 2 V, which enables a safe LED load connection, but mains switchover is needed to power the load.

- **Over temperature protection**

The unit is protected against temporary overheating by automatic reduction of the output power. If t_c exceeds approx. 85 °C the output current is reduced down to the lowest nominal value (800 mA). If t_c exceeds approx. 105 °C the load is shut down. The protection is automatically reversible, without mains switchover

- **Load hot plug protection**

Connection of LED load on secondary side is allowed without damage to the LED; LED will turn on automatically.

7. Precautions in Handling & Use

- 1) To prevent the LED Driver from any defect, please handle and store it with care
 - Do not drop or give shock
 - Do not store in very humid location or at extreme temperature
 - Do not open or disassemble the product
- 2) Static electricity or surge voltage may damage the components inside LED Driver, as such please observe proper anti-electrostatic working process
 - People handling the Driver should be well grounded (e.g. using ESD wrist band) and wear anti-static working clothes and gloves
 - All related devices and instruments in the production line should be well grounded (e.g. working table, measuring equipment, assembly jigs)
- 3) Observe the correct polarity of output terminal
- 4) Avoid input voltage exceeds the maximum rating, which will cause damage to the circuit and result in malfunction
